REPORT

ON THE

VITAL STATISTICS of SCOTLAND for the YEAR 1937.

GENERAL REGISTRY OFFICE OF BIRTHS, &c.,
NEW REGISTER HOUSE,
EDINBURGH, 9th September 1938.

SIR,

In compliance with the requirements of the 7th Section of the Registration of Births, Deaths and Marriages (Scotland) Act, 1854, 17 & 18 Vict., c. 80, I beg to transmit with a view to its being laid before Parliament a Report on the Vital Statistics of Scotland for the year 1937.

The Statistical Summary and the portion dealing with Causes of Death have been prepared under the direction of Dr. Peter L. McKinlay, Superintendent of Statistics in this Department. In addition to the usual Appendices dealing respectively with (1) Vaccination, (2) Marriages, (3) the Weather, there are also included two special Appendices, one on the Fertility of Married Women at various age-periods as shown in the Census Schedules of 1931, and another on the nomenclature of the people of Scotland in 1935.

I am, Sir,

Your obedient Servant,

J. G. KYD,

Registrar-General.

THE SECRETARY,

DEPARTMENT OF HEALTH FOR SCOTLAND.

REPORT TO THE REGISTRAR-GENERAL

BY PETER L. McKINLAY, M.D.,

Superintendent of Statistics.

SUMMARY.

During the year 1937 the usual periodical Returns relating to births, deaths and marriages in Scotland have been issued. Incorporated with the Return for the fourth quarter of the year was an Annual Summary which included, in addition to the leading figures for Scotland and for each of the large burghs, a complete analysis of the deaths in Scotland as a whole, showing the classification of cause of death according to the International short list by sex and by age. The more essential features of the Scottish vital statistics for 1937 have thus already been made available in a condensed form, but this is now superseded by the detailed information

contained in the present Report.

The principal feature in the vital statistics of the year under review was the influenza epidemic in the months particularly of January and February. This has led to a slight increase in the general death-rate for 1937 compared with 1936, and the rate is in fact the highest since 1929, a year also of considerable prevalence of influenza. The death-rate from all causes has over the last four years shown a slight, though progressive increase, but this is largely attributable to the increasing proportion of persons of older age in the population, correction for age differences eliminating a considerable part of the increase. The birth-rate of 1937 has shown a slight fall over that for 1936 and is in fact, with the exception of 1933, the lowest so far observed in this country. The proportion of illegitimate births, 6:15 per cent., is the lowest in Scottish ex-The marriage-rate is the highest for the last 15 years, and has tended to rise progressively since 1931. General mortality, as previously stated, was rather unfavourable; but, viewed over a period of years, and especially after allowance is made for the ageing of the population, distinct improvement is observed. Infant mortality is fractionally lower than in recent years, but the present position and rate of improvement compared with other countries is Although general mortality in the large burghs is discouraging. appreciably in excess of that for smaller towns and county districts, the improvement in the former over the last 20 years is actually relatively greater. Thus for 1911-13 the rates (standardised to the 1931 Scottish population) in the aggregate of large burghs and of county districts were 19.3 and 13.8 per 1,000 population respectively, whereas in the triennium 1931-33 the corresponding rates were respectively 14.6 and 11.9 per 1,000 population. Thus in 1911-13 the urban (large burgh) exceeded the rural death-rates by 40 per cent., whereas twenty years later the excess was reduced to 23 per

cent., although in both aggregates marked diminution is observed. For the year under review the rates for large burghs and county districts, standardised to 1931 population, were 15.08 and 12.36 per 1,000 population, an urban excess still of some 22 per cent. Apart from influenza, mortality from the principal epidemic diseases was favourable except in respect of whooping-cough, to which cause were attributed some 200 more deaths than the average of the preceding quinquennium. Other causes in this group, diphtheria, cerebro-spinal fever, scarlet fever, erysipelas, dysentery, &c., have all shown low or average rates, the deaths from measles being only bettered by the abnormally low prevalence in 1933, and those from typhoid and paratyphoid fevers creating a new low record for this country. Deaths from tuberculosis are practically the same as in 1936, the improvement here being best seen by comparison over a period of years. Deaths from malignant disease, although slightly fewer in number than last year, are above the average for the preceding quinquennial period, which was the most unfavourable found in Scotland. Investigation shows that much of the increase in this cause is to be accounted for by change in the ages of the population over past years, and even since 1931 (since when the crude rate has steadily risen) no deterioration except that which can be explained by difference of age constitution of the population has really taken There is little change in mortality ascribed to cerebral hæmorrhage and allied conditions, to genito-urinary diseases or to respiratory diseases. Deaths from affections of the circulatory system are still on the increase, chiefly due to heart disease and disease of the coronary arteries and occurring principally at ages over 65 years. Part of this is explained by the increasing proportion of elderly persons, but it may also be partly due to difference of certification practice. Diseases of the digestive system show fewer deaths, mainly due to the further decline in diarrhœa and enteritis. Deaths from gastric and duodenal ulcer and from appendicitis are more numerous than in recent years, the trend of the former being definitely upwards. A most satisfactory feature of the year's experience is the further improvement of mortality among women during pregnancy and the puerperium. In 1936 an improvement was manifest and this has continued intensified into the present year, the total maternal death-rate being 4.8 per 1,000 births and for sepsis alone 1.6. The improvement has been mainly in the deaths from puerperal septic conditions (as it was in 1936 compared with the previous years). Deaths from violence have increased during the year, mainly due to accidents, as mortality from suicide is low (the lowest in fact since 1926). The increased accidental deaths were from drowning, railway deaths and accidents connected with motor vehicles.

The principal numbers and rates shown in the Report are as follows:—

Births registered during the year numbered 87,810, being 1,118 fewer than in 1936. The rate, 17.65 per 1,000 population, is only

half of that recorded sixty years ago. Illegitimate births are fewer, 5,404 in 1937 compared with 5,744 in the previous year, the pro-

portion to total births being 6.2 per cent.

Marriages registered during the year numbered 38,351, or 455 more than in 1936. The rate was 7.71, the highest since those of the post-war period. Terminations of marriage by decrees of divorce or nullity totalled 649, which is also the highest number since the years immediately after the War.

Deaths from all causes numbered 68,942, or 1,193 more than in 1936, the rates for the two years being 13.85 and 13.44 per 1,000 respectively. Infant deaths, 7,050, were 265 less than in the pre-

vious year, the rate being 80.3 per 1,000 births.

The total number of deaths from the principal epidemic diseases showed an increase in the present year, due chiefly to influenza (the most severe visitation since 1929, the deaths in that year and in 1937 from this cause being 3,435 and 2,693 respectively) and in less degree to whooping-cough, from which deaths numbered 717.

Deaths from respiratory tuberculosis numbered 2,791 (compared with 2,753 in 1936) and from other forms 872 (912 in 1936). The rate in 1937 from all forms of tuberculosis was 74 per 100,000 population, which contrasts strikingly with one of 404 seventy years ago.

Deaths from malignant disease, 7,810, although slightly fewer than last year, in general tend to be increasing and account for 12

per cent. of all deaths in this country.

The number of deaths of women during childbearing was 424, a decrease of 70 over those in 1936. The rate per 1,000 births is 4·8, those for the years 1931 to 1936 being 5·9, 6·3, 5·9, 6·2, 6·3 and 5·6

respectively.

Violent deaths numbered 3,020, which is 194 more than in the previous year. Of this total, 453 were suicidal in nature, and of the remainder 280 were from burning, 321 from drowning, 107 from accidental suffocation, 608 from road accidents and 120 from accidents in mines and quarries. Deaths from drowning show an increase of 86 compared with 1936, from road accidents an increase of 44, and from railway accidents an increase of 43.

The relative importance of the main causes and cause groups of death remains substantially unchanged, heart disease, cancer, cerebral hæmorrhage and pneumonia being the most outstanding

numerically.

POPULATION.

The estimated population of Scotland as at the middle of 1937 was 4,976,600, of whom 2,396,900 were males and 2,579,700 were females. This represents a net increase over the estimate for the previous year of about 10,300; this increase is attributable mainly to the excess of births over deaths. It is estimated that the population of Scotland has increased since the Census of 1931 by about 133,600 persons. In the Reports which have been issued since that date attention has been drawn to the fact that the increase of

population, although mainly attributable to the excess of births over deaths, has also been partially due to a small inward balance into Scotland by overseas migration. This balance, which in 1931 and 1932 amounted to fully 10,000 per annum, has steadily decreased until now it amounts to little over 2,000 per annum. On the other hand there is evidence that unrecorded emigration, principally to England, is tending to increase, and that this emigration has in recent years considerably exceeded the small inward balance of overseas migration. For the greater part of the ten years between the Censuses of 1921 and 1931 the population of Scotland was declining on account of very large emigration, principally overseas, but this decline appears to have been arrested about the year 1930. While these estimates of population have shown an increase for each year since 1930, the annual increase, which was at maximum between the years 1931 and 1932, when it amounted to about 40,000, has shown a decline in each year, and the increase for 1936–37 is, as already stated, only slightly over 10,000. (Table A.)

BIRTHS.

The number of living children whose births were registered in Scotland during the year 1937 amounted to 87,810, of whom 45,035 were males and 42,775 were females. The sex ratio was thus 105·3 males to every 100 females, being rather above the average for the past 40 years. This ratio moves within somewhat narrow limits, the highest proportion ever recorded in Scotland having been 107·2 in 1933 and the lowest 103·2 in 1905. (Tables 1 and 2.)

Since the year 1876, when the birth-rate reached the highest point recorded since the institution of national registration in Scotland (35.62 per thousand of the total population), the general trend, apart from minor fluctuations, has been steadily downwards, the rates in recent years amounting to little more than half those recorded when the birth-rate was at its maximum, while in 1933, in 1935, and again now in 1937, it has fallen to rather less than half of the maximum quoted above. The only major interruption of this steady decline occurred in the years immediately following

TABLE A.—Population of Scotland and its Groups of Public Health Districts in 1937.

GROUPS OF DISTRICTS.		Census 193 (Resident)	_	1	Census 192 Inumerate		Estimated to 30th June 1937.			
	Both Sexes.	Males.	Females.	Both Sexes.	Males.	Females.	Both Sexes.	Males.	Females.	
Small Burghs Landward .	730,389	339,324 726,235	391,065 731,686	774,681 1,535,259	356,303 757,457	418,378 777,802	756,300 1,488,800	352,500 743,900		

the War. From 1920 the downward tendency was practically continuous till 1933, when the rate reached 17.62, the absolute minimum ever recorded for Scotland. The birth-rate for 1937 was 17.65, being 0.26 less than in the previous year and 0.34 less than the previous five years' average. It is only 0.03 above the minimum Compared with the previous year, the rate recorded in 1933. decline occurred in the first and in the fourth quarters of the year, in each of which the birth-rate was 0.7 less than in 1936, but in the second and third quarters of the year the birth-rate was very slightly higher than in the previous year. It has been observed that if the ten years, 1915-24—representing the War years, when the rates declined rapidly, and the years of high birth-rates following the War—are cut out, the trend of the crude birth-rates since the latter year has tended to follow the downward course of the rates for the years immediately preceding 1915, occupying the approximate positions which they would have had if the trend of these pre-war years had continued. The rates for the years 1934 to 1937 have been rather higher than might have been expected from this trend. This may be partly due to the high marriage-rates which have been recorded during the past four years.

The birth-rate for the year was 18·48 in the large burghs, 16·03 in the small burghs and 16·92 in the landward districts. The decline has been most marked in the small burghs and in the landward districts, where the rates in the previous year were 16·43 and 17·28 respectively. In the large burghs in 1936 the birth-rate was 18·66. Of the total number of births, 57·5 per cent. were registered in the large burghs, 13·8 in the small burghs and 28·7 in the landward districts. In the case of births and deaths, but not of marriages, all local rates quoted in this Report have been corrected

by transfer to place of usual residence. (Table B.)

The geographical variations of the birth-rate will be seen in Tables 4 to 6. In counties, including burghs, the rate ranged from 19·8 in Lanark, 19·4 in West Lothian, 19·3 in Wigtown and 18·4 in Renfrew and in Stirling, to 13·2 in Bute, 12·6 in Berwick, 12·1 in Peebles and 11·8 in Selkirk. In the large burghs the highest

SCOTLAND .	87,810	42,211	40,195	2,824	2,580	17.64	16:56	1.09	6.15	

rates were found in Port Glasgow 24·2, in Hamilton 22·9, in Coatbridge 21·9 and in Stirling 21·8, and the lowest in Dunfermline 15·6, in Inverness 15·0, in Perth 14·6 and in Rutherglen 13·7. In small burghs with populations of 5,000 and over this rate ranged from 22·3 in Johnstone, 21·9 in Campbeltown, 21·7 in Kilsyth and 21·0 in Kirkintilloch, to 11·4 in Dunoon, 11·1 in Galashiels, 10·2 in Milngavie and 9·4 in Largs. In the landward areas of counties it ranged from 19·7 in Wigtown, 19·6 in Lanark and 19·0 in Ayr, to 12·7 in Perth, 12·6 in Peebles, 12·3 in Argyll and 10·6 in Bute.

The monthly birth-rate ranged from 19.9 in April, 19.0 in May and 18.8 in June, to 16.7 in September, 16.3 in October and 16.1 in November. Compared with the previous year the decline in these rates is most marked in October, in March, in January and in November, while increases of 0.5 are recorded both in April and in

August. (Table 34.)

The geographical variations of the birth-rates may be more accurately determined if measured according to the number of births per thousand women aged 15 to 44 years (estimated to number 1,191,400 in 1937), and this is shown in Table C. So measured, the rate for the landward areas is highest (77.5 per thousand), followed by that for the large burghs (73.7) and for the small burghs (66.9), the rate for the whole of Scotland being 73.7. Table 7 shows also the number of legitimate births per thousand married women aged under 45, the rate for Scotland being 152.4. For the landward areas this rate was 156.3, for the large burghs 153.1 and for the small burghs 142.1. This latter standard modifies considerably the relative position of many areas from that shown in the crude birthrate figures of Table 4. Thus the highest rates in the counties in Table 7 are 175.1 in Nairn, 170.7 in Ross and Cromarty, 168.8 in Orkney and 168:0 in Sutherland, in all of which counties the crude birth-rate (Table 4) is less than the rate for Scotland. Among the large burghs the four with the highest rates in Table 7 are the same as in Table 4 and in almost the same order. In the counties the lowest rates are found in Selkirk (109.4), in Berwick (112.1) and in

TABLE C.—Birth-rate per 1000 Women aged 15-44, 1937.

	Estimated Number	Births.	Births. Birth-rate per 1000 of Population.			Birth-rate per 1000 Women aged 15-44.		
GROUPS OF DISTRICTS.	of Women aged 15-44.	Number.	Rate.	Relative Quantity, Scotland being=100.	Rate.	Relative Quantity, Scotland being=100.		
Large Burghs Small Burghs	685,200 181,200 325,000 1,191,400	50,491 12,125 25,194 87,810	18·48 16·03 16·92	104·8 90·9 95·9	73·7 66·9 77·5	100·0 90·8 105·2 100·0		

Peebles (114·2). These counties also show the lowest rates in Table 4. (Table 7.)

The total number of women who gave birth to living children during the year was 86,755. Of them, 85,710 or 98.80 per cent. gave birth to single children, 1,035 or 1:19 per cent. to twins, and 10 or 0.01 per cent. to triplets. Thus of the total number of mothers, 1,045 or 1.20 per cent. of the total gave birth to two or more children. This percentage is the same as in 1934 and in 1936. but with those exceptions this is the lowest percentage of multiple births recorded for Scotland since 1906, when it was 1.18. Between 1855 and 1875 the quinquennial average was invariably 1.20 or over, but from 1876 to 1900 this average was always below 1.20, and only in two individual years was it as high as 1.20. From 1901 to 1920 the tendency was for the proportion of multiple births to increase, and in the five years 1916-20 the percentage was as high as 1.39, being 1.53 in the year 1919. Since then the tendency has been towards diminution, and for the five years preceding 1937 the average was only 1.23. (Tables 1 and 2.)

Illegitimate Births. — These numbered 5,404, and they constituted 6·15 per cent. of the total births. This rate is without exception the lowest ever recorded in Scotland, being 0·06 less than in 1903, which was the previous minimum. It is 0·31 less than in 1936 and 0·63 less than the previous five years' average. Illegitimate births constituted 5·6 per cent. of the total births in large burghs and in the small burghs, but in the landward districts they amounted to 7·6 per cent. of the total.

International Birth-rates.—Compared with the Scottish birth-rate of 17.6, that of England and Wales is 14.9, of Northern Ireland 19.8 and of Eire 19.2. The accompanying table shows the average rates in 1937 for certain countries of the world. The greater portion of these and of the other international rates published in this Report have been kindly furnished by the Secretary-General of the Institut International de Statistique.

MARRIAGES.

Marriages registered in Scotland during the year 1937 numbered 38,351, which is 455 more than in the previous year. The marriagerate, 7.71 per thousand, is 0.08 above that of the previous year and 0.40 above the previous five years' average. For the fourth year in

succession both the number and rate are higher than for any year since the post-war years 1919 to 1921. Apart from these years the rate for the triennial period 1935–37 is higher than for any other triennial period in Scotland. The previous highest triennial average (apart from the post-war period, when it was 8.93) is 7.63 per thousand (1872 to 1874), but the average for 1935–37 is 7.67. During the three years following the War the marriage-rates were 9.14 in 1919, 9.61 in 1920 and 8.04 in 1921. The marriage-rate has never at any time since the institution of national registration in Scotland in 1855 been less than 6 per thousand. (Tables 2 and 3.)

The marriage-rate was highest in the aggregate of large burghs (9.08) and lowest in the landward districts (5.31), that for the small burghs being 7.45. (Table D.) The relative position of these three aggregates is in conformity with the experience of previous years. For individual geographical areas the rates are shown in Tables 4 to 6. As already indicated, the numbers referring to marriages have not been corrected in any way for transfer to place of usual residence. The high rate in the large burghs is to some extent due to the tendency to resort to these areas for the purpose of celebrating marriages, especially irregular marriages.

The monthly marriage-rate ranged from 11.8 in July and 11.0 in

June to 5:1 in February and 4:2 in May. (Table 34.)

Compared with the Scottish marriage-rate of 7.7 per thousand that for England and Wales is 8.7, for Northern Ireland 6.6 and for Eire 5.1. Marriage-rates for various countries are given in the following table:—

MARRIAGE-RATES. 9.5 Poland New Zealand . 8.0 Canada . 9.1 7.98.8 Scotland . 7.7 England and Wales . 8.7 Netherlands 7.78.7 Sweden . . . 7.2Switzerland

	Marriages.	Marriage-rate per 1000 of Population.
GROUPS OF DISTRICTS.	Number.	Rate. Relative Quantity, Scotland being = 100.
Large Burghs	24,810 5,634 7,907 38,351	9.08 117.8 7.45 96.6 5.31 68.9 7.71 100.0

Divorce.—By decrees pronounced in Scotland during the year, 649 marriages were terminated, 642 by divorce while 7 were declared null. Of these, 567 affected marriages registered in Scotland and 82 affected marriages registered elsewhere. The trend of these figures over the whole period of registration has been upwards, increasing steadily from an annual average of 17 in 1855–1864 and 14 in 1865–1874 to one of 458 in 1915–1924, with a maximum of 829 in 1919. For the ten years 1925–1934 this average shows a small increase to 488, the number in 1937 being thus 161 more than that average. The number in 1937 is 7 more than in the previous year, and is the largest number recorded in any year except 1919 and 1920. (Table E.)

DEATHS.

Deaths registered during the year numbered 68,942, the annual rate per thousand population being 13.85. This rate is 0.41 above that for the previous year and 0.60 above the previous five years' average. Among males the death-rate was 14.59 per thousand and among females 13.17. Apart from slight annual variations, the general trend of the combined rate since the early days of registration has until very recent years been steadily downwards, deathrates of over 23 per thousand having been recorded in 1864 (a maximum of 23.58), in 1874 and in 1875, and an absolute minimum of 12.92 being reached in 1934. But since 1934 each year has shown an increase in the death-rate, and the rate for 1937 is higher than in any year since 1929, when, as in 1937, influenza was prevalent. As already indicated, the death-rate is 0.41 per thousand higher than in 1936, and this may be attributed to the epidemic of influenza in the early months of the year, the death-rate from that cause being also 0.41 higher than in the previous year. But apart from such year to year variations the downward trend of the death-rate, as indicated above, would seem to have been arrested during the last three years. As the general death-rate, after the years of childhood, increases with age, it follows that, other things being equal, the death-rate will tend to increase as the population grows older. Both in 1921 and in 1931 it was found that the population was on the average older by almost two years than at the preceding Census, and this increase appears to be continuing. In 1931 the death-rate

				1937	Marketon Marketon	649	

was 13:26 and in 1937 it was 13:85. But if allowance is made for difference in the age and sex distribution in 1937 compared with 1931, the death-rate for 1937 so standardised is found to be 13:32. It would appear, therefore, that much the greater part of the increase between 1931 and 1937 is due to the ageing of the population rather than to any deterioration in the standard of health. The effect of standardising the Scottish death-rates for recent years to the age and sex distribution of the population found in Scotland at the Census of 1931 is seen in the following series:—

		Crude Death-rate.	Standarised Death-rate.	Effect of Standardisation.
1931		 13.26	13.26	physicalsini
1932		 13.53	13.44	-0.09
1933		 13.20	13.08	-0.12
1934		 12.92	12.74	-0.18
1935		 13.19	12.86	-0.33
1936		 13.44	13.02	-0.42
1937	0 0 0	 13.85	13.32	- 0·53

It will thus be seen that the standardised death-rate for 1937 is only 0.06 above that for 1931, and that a considerable part of the increase in the death-rates since 1934, the year of minimum death-rate, may be attributed to the ageing of the population.

Comparison of the mortality-rates in the three large aggregates of districts shows a direct relationship to urbanisation. When the crude death-rate, i.e. the rate shown only as "corrected for transfer," is taken as the standard for comparison, this association is not so apparent, but when these rates are standardised for differences of age and sex constitution of the population (the population of Scotland in 1931 being taken as standard) the increase in mortality in the urban areas as compared with the rural areas is marked. In the landward areas the standardised rate was 12·36 per thousand, in the small burghs it was 12·95, and in the large burghs it was 15·08. (Table F).

TABLE F.—Deaths in Scotland and its Groups of Public Health Districts in 1937.

	Dea	ths.	Death-rate per 1000 of Population.		
GROUPS OF DISTRICTS.	Registered Number.	Corrected for Transfers.	Corrected for Transfers.	Corrected for Transfers and Adjusted for Age and Sex Distribution, 1931.	
Large Burghs	42,123 9,156 17,663	38,600 10,723 19,619	14·13 14·18 13·18	15·08 12·95 12·36	
SCOTLAND	68,942	68,942	13.85		

In the counties, inclusive of burghs, the highest death-rates (standardised for age and sex) were found in Lanark (15·8), in Ayr (14·5), in Renfrew and in Dunbarton 14·1 and in Angus 14·0, and the lowest in Sutherland 10·4, in Nairn 10·5, in Inverness 11·0 and in Banff 11·3. In the large burghs taken individually this rate ranged from 16·8 in Greenock, 16·6 in Coatbridge, 16·4 in Glasgow and 15·9 in Ayr, to 13·0 in Perth, 12·9 in Falkirk, 12·4 in Kirkcaldy and 12·2 in Inverness. In small burghs with populations of 5,000 and over this rate ranged from 16·3 in Ardrossan and in Helensburgh, 16·0 in Kilsyth and 15·8 in Campbeltown, to 11·2 in Bo'ness, 10·8 in Oban, 10·5 in Forfar and 10·4 in Peterhead. In landward areas it ranged from 14·1 in Ayr, 13·9 in Lanark, 13·8 in Stirling and 13·6 in West Lothian, to 10·6 in Aberdeen and in Banff, 10·5 in Inverness, 10·2 in Sutherland and 10·0 in Nairn. (Tables 4–6.)

The monthly death-rate ranged from 20.6 in January, 17.3 in February and 16.6 in December, to 10.9 in September and 10.6 in

August. (Table 34.)

The following table gives the crude death-rates of various countries, but while these rates give a general indication of the mortality in these countries, they are not corrected in any way for differences in the age and sex distribution of the populations concerned. Compared with the Scottish death-rate of 13.9, that for England and Wales is 12.4, for Northern Ireland 15.1 and for Eire 15.3. Rates for various countries are included in the following table:—

Death-rates.											
Eire		15.3	Sweden .	•		12.0					
Northern Ireland		15.1	Germany .	•	•	11.7

Austria			Canada .			10.2					
Czecho-Slovakia		13.3	New Zealand			9.1					
England and Wales	•	12.4	Netherlands			8.8					

Age and Sex.—The death-rates in separate age and sex groups show generally the differences usually found, namely, higher male than female mortality at each age period, and the characteristic increase of the mortality-rates with age after childhood. Table G (1) shows the population estimates by age periods on which the rates for 1937 have been based, and from Table G (2), in which comparison is made of the death-rates at ages in each sex since 1911, there will be seen the amount of improvement which has taken place since that date. Apart from the final age-group, for which comparative rates are not complete, mortality throughout this period has fallen in each separate group. This change is specially marked among children aged between 1 and 5 years, the mortality in this age-group being in 1937 very much less than half of the corresponding death-rate in 1911–1915. The improvement

in the rate diminishes generally with advancing age, the rates at the highest ages showing only a comparatively small decline. Comparing the death-rates of each age with those for the previous year, it is found that the death-rate has declined at ages under 5, but it shows little change between the ages of 5 and 15, and there has been a rise in almost all age-groups thereafter, although the increase is inconsiderable except at the very highest ages. In the large burghs the death-rate is higher than in the rest of Scotland in every age-group. (Table 19.)

Infantile Mortality.—Deaths of children aged less than I year numbered 7,050, and as births numbered 87,810, the infantile mortality-rate is 80·3 per thousand births, that for males being 89·6 and for females 70·5. Compared with the previous year, the rate for both sexes is less by 2·0, that for males being less by 2·6 and for females less by 1·4. The rate for both sexes is 0·5 below the previous five years' average. Up to and including 1915 this rate was invariably over 100, but since that year it has only three times exceeded that figure. Apart from comparatively small year-to-year variations, the tendency has been fairly steadily downwards since the beginning of the century, although the rates for 1936 and 1937 have both been higher than those for the years 1934 and 1935. As is usually the case, the rate was highest in the large burghs, where it was 90,

TABLE G (1). - Estimated Population of Scotland, by Age and Sex, 1937.

that for the small burghs being 69 and for the landward areas 66. The rate in the small burghs is 3 higher than in the previous year, but in each of the other groups it is 3 lower. In the large burghs it ranged from 114 in Kilmarnock, 104 in Glasgow, 100 in Ayr and 99 in Coatbridge, to 70 in Edinburgh and in Falkirk, 69 in Dumbarton, 67 in Kirkcaldy and 59 in Dunfermline. In the counties, exclusive of large burghs, the rate ranged from 82 in Ayr and in Banff, 80 in Moray, and 74 in West Lothian, in Caithness and in Angus, to 38 in Kinross, 36 in Zetland, 34 in Peebles and 33 in Sutherland. (Table 4.)

The infantile mortality-rate ranged from 109 in December and 100 in January and in November, to 63 in September, 60 in August

and 56 in July. (Table 34.)

Among legitimate children the infantile mortality-rate amounted to 78 per thousand legitimate births for Scotland as a whole. For the large burghs this rate was 87 per thousand births and for the rest of Scotland 65. The rate among illegitimate children was 122 for Scotland, 145 for the large burghs and 96 for the rest of Scotland. In 1936 these rates were 120, 135 and 104 respectively. Comparing the illegitimate rate with the legitimate, the excess of the former rate is greatest between the ages of one week and two months. (Table 33.)

Compared with the infantile mortality-rate of 80.3 in Scotland, that in England and Wales was 57, in Northern Ireland 77 and in Eire 72. Rates for various countries are included in the following

table:—

Infantile Mortality per 1,000 Births.

Canada		76	New Zealand .		31

Centenarians. — The deaths of 16 reputed centenarians were registered during the year, 4 being males and 12 females. After the usual examination the age was verified as being at least 100 years in 10 cases. Of those whose ages were verified, three were aged 100 years, two were 101, two were 102, one was 104, one was 105, and one (a female) was aged 106 years and 51 weeks. The greatest age yet verified in these Reports occurred in 1936 and was 109 years and 14 days, but with that exception the greatest age now verified for 1937 is the highest on record since the practice of endeavouring to verify the ages of centenarians was commenced in 1910. Since that date 388 such deaths have been registered, 64 being of males and 324 of females, and the age has been verified as being at least 100 years in 205 instances. In 70 cases the evidence found was against the claim, while in 113 cases no satisfactory

evidence of age could be obtained. The proportion of ages verified has increased steadily and has exceeded 60 per cent. in the last ten years.

CAUSES OF DEATH.

Certified Deaths. — Of the 68,942 deaths registered in 1937, 68,743 or 99.7 per cent. were certified as to cause of death by a registered medical practitioner or by Procurator-Fiscal's report and 199 or 0.3 per cent. were uncertified. The latter number is the lowest on record, being 14 less than in 1936, which was the smallest number recorded up to that date. It is in marked contrast to the figure prevailing fifty years ago, when the average number of uncertified deaths was over 6,000. (Table H.)

The cause of death was specified in 67,932 cases, or 98.5 per cent. of the total deaths, while in 1,010 or 1.5 per cent. it was either ill-defined or not specified. Of the latter, 996 were attributed to sudden death, syncope, heart failure or other ill-defined cause, while in 14 cases the cause was unspecified.

Principal Epidemic Diseases. — Deaths from the principal epidemic diseases (Nos. 1-18 of International List) numbered 4,468, as compared with 2,719 in the previous year. The death-rate was 90 per 100,000 and is 35 more than in the previous year. It is the highest epidemic rate since 1929. This is principally due to an epidemic of influenza which was prevalent in the months of January and February, and which was responsible for the deaths of 2,693 persons throughout the year. In the previous year only 659 deaths were due to influenza, and the number for 1937 is the highest for any year since 1929, when it amounted to 3,435. The death-rate from influenza was 54 per 100,000 in 1937. Next to influenza the most important cause of death was whooping-cough, which was responsible for 717 deaths, the equivalent annual death-rate being 14 per 100,000. This number is 201 above the five years' average and the rate is 4 above. The very great majority of these deaths occurred in the first five months of the year. Deaths from diphtheria numbered 426, the equivalent death-rate being 9 per

TABLE H.—Deaths from Uncertified Causes, 1881-1937.

Year.	Uncertified Causes.	Percentage of Uncertified to Total.	Year,	Uncertified Causes.	Percentage of Uncertified to Total.

100,000. These deaths are 15 fewer than the five years' average, while the rate is the same. Deaths from cerebro-spinal fever numbered 144, the rate being 3 per 100,000. These deaths are 24 fewer than the five years' average. Scarlet fever accounted for 123 deaths, which was equal to a rate of 2 per 100,000. This number is 132 below the five years' average and the rate is 3 below. This is the smallest number of deaths from scarlet fever ever registered in Scotland in any year, with the single exception of 1929, when the number was 109. Deaths from measles numbered 119 and are equal to a death-rate of 2 per 100,000. This number is 420 below the five years' average and the rate is 9 below. With the single exception of 1933, when deaths from measles reached the abnormally low total of 36, this is the lowest on record for Scotland in any year. Deaths from typhoid fever numbered 11 and from paratyphoid fevers 5. The total from these two is 23 less than in 1936 and is the lowest number on record, the previous lowest being 22 in 1934. Other diseases in the epidemic group include 109 from erysipelas (52 fewer than in the previous year), 85 from lethargic encephalitis (10 fewer), 25 from dysentery (12 fewer) and 11 from acute poliomyelitis (13 fewer). Deaths from syphilis numbered 79 and from other venereal diseases 6. The "other infectious diseases" referred to on page 7 will be found in detail in Table J. They include 7 deaths from pink disease, and 3 each from German measles, from chickenpox and from infective jaundice.

Tuberculosis.—Deaths from all forms of tuberculosis, exclusive of those associated with influenza, numbered 3,663, and are 2 fewer

TABLE J.—The Causes of Death shown in the International Headings, Nos. 44 and 69, on pages 7 and 9, consisted of the following (age in brackets):—

than in the year 1936 and only 17 more than in 1935, which was the smallest number ever recorded in Scotland. The death-rate was 74 per 100,000, being the same as in 1936 and in 1935, and 3 below the five years' average. The death-rate from tuberculosis has declined rapidly in recent years, the rate in the period 1866-1870 having been as high as 382, but in the past four years it has shown little or no change. Mortality from this cause was highest in the large burghs (89), while in the small burghs and in the landward areas it was 55. Compared with the previous year the rate in the large burghs was 2 less, in the small burghs the same and in the landward areas 2 more. In the individual large burghs this rate ranged from 132 in Greenock, 121 in Coatbridge, 110 in Rutherglen and 106 in Glasgow and in Avr., to 50 in Arbroath, 43 in Airdrie, 38 in Kirkcaldy and 31 in Port Glasgow. In Edinburgh it was 81. In the counties, exclusive of large burghs, this rate ranged from 120 in Ross and Cromarty, 111 in Zetland, 86 in Bute and 78 in Sutherland, to 32 in Selkirk, 24 in Nairn, 23 in Berwick and 14 in Kinross. The death-rate for Scotland from the respiratory form of the disease was 56 and from other forms 18.

Mortality from tuberculosis, as already indicated, has been steadily declining for many years past, both absolutely and relatively. Thirty years ago (1901–1905) the pulmonary and non-pulmonary forms of the disease accounted for approximately 8.5 and 4.3 per cent. respectively of the total male deaths, whereas now the corresponding proportions are 4.4 and 1.3 per cent. Among females a similar trend is manifest. Formerly 8.7 per cent. of all female deaths were from pulmonary forms of tuberculosis and 3.9 per cent. from non-pulmonary, but these proportions have now fallen to 3.7 and 1.2 respectively. A special report on the decline of the death-rate from tuberculosis was included in the Annual Report for 1935.

Malignant Disease.—Deaths from this group of causes numbered 7,810 and are equal to a death-rate of 157 per 100,000. Compared with the previous year the deaths are 99 fewer and the rate 2 less, but the rate is 2 more than the five years' average. What has already been said (see page xiv) about the effect on the general death-rate of the ageing of the population applies in an even more marked degree to the death-rate from cancer, which is essentially a disease of the more advanced ages. If allowance is made for the estimated ageing of the population since 1931 it is found that the increase in the death-rate from cancer between 1931 (148) and 1937 (157) appears to be entirely due to the increasing age of the population.

The most frequent sites among males were the digestive system (stomach, intestine, rectum, liver and æsophagus), the genito-urinary system, the respiratory system and the buccal cavity (mouth, tongue, &c.). Among females the sites affected, in order of numerical importance, were the digestive system, breast and genitalia. Compared with the previous year, increases are noted from malignant disease of the pancreas and of the lung, while

decreases are observed in those cases affecting the larynx. Among male deaths those from cancer of the rectum show a considerable increase, but those from cancer of the intestine show a rather large decrease. Male deaths from cancer of the tongue and of the stomach and pylorus are also markedly fewer. (Table 28.)

Diabetes.—Deaths from this cause numbered 867, an increase of 59 as compared with 1936. Male deaths numbered 280 and female deaths 587. The death-rate, 17 per 100,000, is 1 more than in the previous year. In 1925 deaths from diabetes numbered 457, which was lower than for the immediately preceding years, but since that year the number has generally increased. Compared with the average for the past five years deaths from diabetes numbered 130 more. Of this increase 94 occurred among females and only 36 among males. In the Report for 1936 attention was drawn to the fact that the increase was at the older ages, while deaths at the younger ages showed little change, or in some cases an appreciable decline. In 1937 deaths among males at ages under 45 declined from 51 (in 1936) to 37, and among females they declined from 51 to 36. A more detailed examination of the trend of mortality from this cause was given in an Appendix to the Annual Report for 1931. It was then found that at that date any improvement was greater among males than among females, that there was definite improvement at the younger ages, but that in later life mortality had increased. It is now found that while deaths from diabetes are increasing, the increase is less among males than among females and that death is occurring at later ages.

Other General Diseases.—In addition to the foregoing diseases there were 226 deaths from rheumatic fever, being the same as in 1936, 136 from chronic rheumatism, osteo-arthritis (2 fewer than in 1936), and 312 from anæmia, of which 253 were attributed to pernicious anæmia. The deaths from all forms of anæmia were the same as in the previous year, but those from pernicious anæmia are 17 fewer. Deaths from diseases of the thyroid and parathyroid numbered 190, being 5 more than in the previous year, and those from leukæmia and aleukæmia numbered 177, being 25 more than in the previous year. Deaths from pernicious anæmia were more fully dealt with in an Appendix to this Report for 1931. The diseases summarised under No. 69 on page 9 are shown in detail in Table J.

Diseases of the Nervous System.—Deaths from this group of diseases numbered 7,999 and are 117 fewer than in the previous year. They include 61 from cerebral abscess and other inflammation of the brain, 181 from meningitis other than tuberculous or cerebro-spinal, 94 from general paralysis of the insane and 56 from locomotor ataxy. The deaths from each of these causes are fewer than in the previous year. Those from cerebral hæmorrhage, apoplexy, embolism, thrombosis and softening numbered 6,018,

while those from hemiplegia and other or unspecified forms of paralysis numbered 393, the deaths in these groups numbering 48 more than in the previous year, when the deaths from this group numbered fewer than for several years. (Page 11.)

Diseases of the Circulatory System.—Deaths from this group of diseases numbered 15,732 and are 545 more than in the previous year. Of them, 14,360 were attributed to heart disease, 724 to arterio-sclerosis, 261 to gangrene, 139 to aneurysm and 87 to diseases of the veins. In the Report for last year the increase in the number of deaths certified as due to heart disease was commented upon. It was pointed out that in eleven years they had increased from 7,375 to 13,698, and another increase of 662 compared with 1936 has now to be noted. As was the case in 1936, it is found that the largest increases are at ages over 65, 575 of the additional deaths compared with 1936 having occurred at these ages. Deaths from diseases of the coronary arteries (including angina pectoris) continued to increase, numbering 1,756 in 1937, as against 1,584 in 1936 and 946 in 1932. (Table 23 and page 13.)

Diseases of the Respiratory System.—Deaths from these causes, excluding those associated with influenza and with tuberculosis, numbered 9,087, being 2 fewer than in the previous year. Of them, 38 were ascribed to diseases of the nose and 34 to diseases of the larynx, 3,273 to bronchitis, 4,858 to pneumonia (of which 1,515) were certified as due to lobar pneumonia), 162 to pleurisy and 722 to other respiratory diseases (of which 378 were classified to congestion of the lungs). The deaths from bronchitis are 57 fewer than in the previous year and those from pneumonia are 65 more. If to these deaths there are added those in which influenza was specified as leading to the respiratory condition named, it is found that the death-rate from bronchitis was 73 per 100,000, being 5 above the five years' average, and the death-rate from pneumonia was 123, or 15 above the average. In recent times it has generally been found that in those years in which influenza was epidemic the deaths from pneumonia and from bronchitis correspondingly increased. In 1937 there was a very marked increase, as already indicated, in the number of deaths from influenza, the number being higher than in any year since 1918-19 with only 2 exceptions, 1922 and 1929. On this occasion, however, there is only a small increase in the number of deaths from pneumonia and the number from bronchitis has slightly decreased. In the ten years 1921 to 1930 the inter-relation between the number of deaths from influenza. from pneumonia and from bronchitis was marked, but in more recent years the tendency has been less pronounced. (Table 26 and page 14.)

Diseases of the Digestive System.—The total number of deaths ascribed to this group of diseases, apart from malignant disease and tuberculosis, was 3,781, being 141 fewer than in 1936. Deaths

from gastric and from duodenal ulcer numbered 694 as against 627 in the previous year. Those from diarrhœa and enteritis at all ages numbered 1,013 as compared with 1,172 in the previous year. As is usually the case, the number of deaths from diarrhœa was higher during the later summer months, the maximum numbers being registered in September and in October. Of the total number of deaths, 452 occurred in Glasgow. Deaths from ulceration of the intestines numbered 61, a decrease of 2 from the previous year, and those from appendicitis numbered 452, being 19 more than in the previous year. Deaths from diseases of the liver numbered 584, being 11 more than in the previous year. They include 196 from cirrhosis of the liver, 119 from gallstones and 196 from cholecystitis. (Page 16.)

Diseases of the Genito-Urinary System. — These collectively numbered 2,921, being 122 more than in the previous year. Deaths from diseases of the kidney numbered 2,071, an increase of 106, from urinary calculus and conditions affecting the bladder and urethra 258, a decrease of 18, from diseases of the male reproductive organs 515, an increase of 41, and from diseases of the female reproductive organs 77, a decrease of 7. (Page 18.)

Diseases of Pregnancy and Childbirth.—These collectively numbered 424 and are 70 fewer than in the previous year. Of the 14

^{*} See explanatory note on page xxv.

headings under which deaths from puerperal causes are classified in the detailed list, decreases (compared with the previous year) were recorded in nine, no change in one and small increases in four. Deaths from puerperal sepsis (including post-abortive) accounted for 144 and are 51 fewer than in the previous year, while there were 71 from puerperal albuminuria and convulsions, being the same as in the previous year, 61 from puerperal hæmorrhage, being 14 fewer than in the previous year, 13 from abortion not returned as septic, being 7 fewer, and 34 from phlegmasia alba dolens or embolism, being 5 more than in the previous year. Deaths from all puerperal causes are equal to a rate of 4.8 per thousand births, the rate for sepsis alone being 1.6 and for other puerperal conditions 3.2. It will be observed that the improvement in this rate is almost entirely due to the decline in the number of deaths from sepsis. In the large burghs the rate from all puerperal causes was 5.1, in the small burghs 4.6 and in the landward districts 4.3. In the groups of districts the decline was most marked in the small burghs, where the decrease compared with the previous year amounted to 1.2, this being followed by the rate for the landward districts, which declined by 0.9, while that for the large burghs declined by 0.6. Death-rates from septic and from non-septic conditions are shown for each Public Health District in Table 27. A detailed examination of the mortality from diseases and accidents associated with child-birth appeared in the Annual Report for 1931. (Page 19.)

In addition to the deaths assigned to puerperal conditions there were 142 deaths associated with pregnancy and parturition, but which were not classified as such. These are shown in Table K. They include 39 from all forms of pneumonia, 25 from influenza, 20 from heart disease, and 15 each from tuberculosis and from diseases of the digestive system. It should be borne in mind that this supplementary table includes all cases in which the certifier stated on the death certificate that the death had occurred during pregnancy or within four weeks thereafter, but in the great majority of these cases the certificate did not actually specify this condition as a cause of death.

Diseases of the Skin and Cellular Tissue.—The total number of deaths in this group was 332, being 24 more than in the previous year. Of these deaths, 62 were attributed to carbuncle or boil and 200 to cellulitis or acute abscess. (Page 20.)

Diseases of the Organs of Locomotion.—These account for 128 deaths and are 23 less than in the previous year. Of them 77 were ascribed to acute infective osteomyelitis and 34 to diseases of the joints. (Page 20.)

Malformations.—To this group were assigned 615 deaths, being 10 more than in the previous year. In last year's Report reference was made to the increasing number of deaths from these causes, and this year a small increase is again recorded. As is usually the case, male deaths were in considerable excess of the female (339 as against 276). Of the total number 69 were attributed to congenital hydrocephalus, 162 to spina bifida or meningocele, 205 to congenital heart disease, and 179 to other congenital defects. Deaths from congenital hydrocephalus are 15 more than in the previous year, but other causes show little change. Of the deaths from malformation 561 occurred in the first year of life. (Table L.)

Diseases of Early Infancy. — Deaths from these causes collectively numbered 2,794 and are 21 fewer than in the previous year. Of them, 693 were ascribed to congenital debility, 1,532 to premature birth, 263 to injury at birth, and 306 to other diseases peculiar to early infancy. Deaths from injury at birth are 47 more than in the previous year.

Senility.—Deaths assigned to senility or to senile dementia numbered 2,494 and are 62 more than in 1936. (Page 21.)

Violence. —Deaths from this cause numbered 3,020 and are 194 more than in the previous year. This is the largest number of deaths from violence since 1930, when the number was 3,060. Of these deaths 2,023 were of males and 997 of females. Deaths attributed to suicide numbered 453, a decrease of 43, to homicide 18, a decrease of 10, to war injuries 6, a decrease of 6, and to accidental causes 2,543, an increase of 253. The number of deaths from suicide is the smallest recorded since 1926, when the number was 424. Of the 453 suicidal deaths 233 were by poisoning, of which 158 were by coal gas and 49 by lysol and allied preparations. Suicidal deaths by other forms of poisoning numbered 26, including 12 from the barbiturate group (luminal, &c.). (Tables 29 and 30 and page 21.)

Of the accidental deaths 257 were attributed to burns and 23 to

conflagration, 321 to drowning, 5 to food poisoning, 45 to gaseous poisoning (of which 39 were by coal gas), 8 to other acute accidental poisoning, 107 to accidental suffocation, 6 to injury by firearms, 30 to weather agencies and 9 to electricity (lightning excepted). Deaths from accidental drowning are 86 more than in the previous year but only 27 more than the previous five years' average. During the first two months of the year the weather was exceptionally stormy (see page xliv) with consequent loss of life at sea. Other differences are of a more normal character. In addition to the deaths from accidental poisoning there were 149 others in which death occurred during or after the administration of an anæsthetic for therapeutic purposes, and in which the anæsthetic may or may not have been a contributory cause. In 28 of these cases the anæsthetic used was ether, in 25 chloroform alone, in 21 chloroform and ether, in 21 nitrous oxide and ether, in 16 nitrous oxide alone. and in 10 ethyl chloride and ether. In the Report of 1936 attention was drawn to the decline in the number of deaths under chloroform alone and to the increase in those under ether alone, but in 1937 this tendency was reversed, as deaths under ether declined from 35 to 28, while those under chloroform increased from 14 to 25. The full list of the anæsthetics used and also of the poisons in the suicidal and the accidental deaths will be found in Table 30.

Deaths due to accidents in coal and other mines and quarries numbered 120, being 5 more than in the previous year, to machinery

* Including 2 of unstated age.

33, being 6 more than in the previous year, to railway accidents 114, an increase of 43, to tramway accidents 20, a decrease of 6, to accidents in connection with motors and other forms of mechanical transport 608, an increase of 44, to accidents in connection with horse-drawn vehicles 16, an increase of 1, in connection with water transport 42, an increase of 6, and in connection with aircraft 16, an increase of 8. The increase in the number of deaths from railway accidents was largely due to the collision at Castlecary. (Table M.)

Motor Accidents.—Of the 608 deaths from motor accidents, 462 were of males and 146 of females. While this excess of male deaths occurred at every age period, it is specially marked between the ages of 15 and 44. The accompanying Table N has been prepared to show the number of deaths attributed to accidents in connection with motors and horse-drawn vehicles respectively within the last two decennial periods. It will be seen that deaths from accidents with motor vehicles increased to a maximum of 747 in 1930. From 1931 to 1934 the number was fairly steady and nearly 100 per annum fewer, the total both for 1933 and 1934 being 662. In 1935 it declined to 555, and for 1936 it increased very slightly to 564. It has now again increased to 608 for 1937, this being the largest increase in any year since 1930. Deaths from accidents with horse-drawn vehicles have tended downwards, the annual average for 1911 to 1920 being 49 compared with 18.5 during the period 1921 to 1930, and, as already indicated, the number in 1937 was 16.

Relative Frequency of Causes of Death. — Table O shows in order of frequency the causes of death to which were ascribed at least 1 per cent. of all deaths during 1937, together with the corresponding figures for the previous year. The list includes 54,734 deaths, or 79.4 per cent. of the total registered during the year. The four most frequent causes were heart disease, malignant tumours, cerebral hæmorrhage and allied conditions, and pneu-

monia. Compared with the previous year there are increases in the proportion of deaths attributed to heart disease, to violence and to influenza, while decreases are shown for malignant tumours, cerebral harmorrhage and allied conditions, pneumonia, tuberculosis, diseases of early infancy and bronchitis. In some of these cases the changes are relatively unimportant. In 1921–30 deaths from heart disease accounted for 11.5 per cent. of the total deaths, and in 1937 this percentage had risen to 20.8.

Infant Deaths-The most important causes of death under one year of age were congenital causes, all forms of pneumonia, diarrhœa, whooping-cough, bronchitis and convulsions. Deaths from these and other causes at the various stages of life under one year will be found in Table 31. From this Table it will be observed that of the 7,050 children who died before completing their first year 1,057 did not survive one day, 1,152 others did not survive one week and 1,152 others did not survive one month. Table P (1) shows the proportions who died at these ages in recent years. It will be noted that in the groups of years ending in 1935 there has been slight improvement at each age period between one and six months, although this was not maintained in the last two years. The greatest improvement has been in the period between six months and one year, in which case the improvement has continued until 1937, the rate for which is the lowest shown in the Table. In Table 32 will be found the month of the year in which these infant deaths occurred. The numbers ranged from 778 in December and 736 in March to 432 in September and 427 in July. Table 33 shows for each Public Health District the distribution of these infant deaths according to age (days, weeks, &c.). (Tables 31-33.)

There have been added to these Tables for the first time extended figures for the deaths of illegitimate infants. As already indicated in an earlier section of this Report the infantile mortality among illegitimate children is about 50 per cent. greater than among the legitimate. From Table 33 it will be seen that this ratio is considerably exceeded between the ages of one week and three months, that at ages under one week this ratio is maintained, but that at ages over six months the excess mortality is considerably less, although it is still higher than among legitimate children. relative excess in the mortality among illegitimate children is maintained both in the large burghs and in the rest of Scotland. This rate is calculated for each of the 55 Public Health Districts, but it is necessary to point out that, as the figures are in some cases based on a very small number of observations, they are not all equally significant, and that observations for another year might yield very different results. Table 31 shows these deaths classified not only according to age but also according to cause of death. In the case of the more important causes of infant deaths, the excess mortality among illegitimate children as compared with legitimate is greatest in the case of deaths from congenital debility, from injury at birth and from diarrheal diseases, but is less marked in the case of deaths from whooping-cough, from congenital malformations and from premature birth. (Tables 31-33.)

Children under Five Years.—Table P (2) shows the deaths from certain causes in children under five years of age. The total number of deaths in this age-group is 9,245, being 507 fewer than in the previous year, but if children under one year are excluded the number (i.e. at ages 1 to 4 inclusive) is 2,195, which is 242 less than in the previous year, and, as will be seen from Table 24, the death-rate is 6.9 per thousand against 7.6 in 1936. Deaths from measles are fewer by 290, but this is to a large extent counterbalanced by an increase of 159 in the case of whooping-cough.

Deaths from diphtheria are also more by 32, but those from tuberculosis (all forms) are fewer by 43, from all digestive diseases by 41 and from pneumonia by 40. The leading causes of death in this age-group (1-4) are pneumonia (564), whooping-cough (336), all forms of tuberculosis (211), including 123 from tuberculous meningitis, diphtheria (178) and diseases of the digestive system (168).

APPENDIX I.

SEVENTY-THIRD ANNUAL REPORT ON THE VACCINA-TION OF CHILDREN IN SCOTLAND (1936).

This report deals with the vaccination of children born in Scotland during the year 1936 who in the ordinary course should have been vaccinated during that year or during the first half of the year 1937.

Children whose births were shown in the Vaccination Returns for the year 1936 numbered 88,932, of whom 5,622 died before reaching the age of statutory vaccination (six months), while 83,310 survived at that date, and it is the latter number which more

especially falls to be considered here. (Table 36.)

Of the 83,310 children surviving at the time of statutory vaccination, 37,022 or 44.44 per cent. were either certified to have been successfully vaccinated or reported to be insusceptible to vaccination by reason of previous uncertified vaccination, 1,105 or 1.33 per cent. were certified as insusceptible to vaccination for reasons other than previous vaccination, and 45,183 or 54.24 per cent. were not reported as vaccinated, the majority of these, 40,796 or 48.97 per cent. of the total, being unvaccinated by reason of Declaration of Conscientious Objection on the part of the parents. This is the ninth year in succession in which the last-named percentage has shown an increase. (Table 36.)

The vaccinated children numbered 37,022, for whom the statutory certificates of vaccination were submitted in respect of 36,809 and certificates of previous vaccination in respect of 213. These 37,022 children constituted 44.44 per cent. of those surviving at the time of statutory vaccination, a rate which is 0.81 less than in the previous year. Prior to the passing of the Vaccination (Scotland) Act, 1907, by which conscientious objection on the part of the parents became a valid reason for avoiding statutory vaccination, over 91 per cent. of the children born in Scotland and surviving at the time of statutory vaccination were successfully vaccinated, but thereafter the proportion fell, being less than 50 per cent. in 1918. In the year 1920, when there was an outbreak of smallpox in Glasgow, this rate rose to 71 per cent., but since then it has steadily declined, reaching the lowest so far recorded of 44 per cent. in the year under review. In the counties, burghs included, the percentage of children surviving at the time of statutory vaccination who were successfully vaccinated ranged from 82.2 in Peebles, 80.3 in Kincardine, 78.6 in Kirkcudbright and 78.2 in Nairn, to 26.1 in Dunbarton, 19.3 in Caithness,

18·3 in Orkney and 6·3 in Zetland. In sixteen counties less than half of the children surviving at the time of statutory vaccination were reported to be successfully vaccinated. In Zetland the births registered during the year numbered 278, and children surviving at the time of compulsory vaccination numbered 270, of whom only 17 were reported to be vaccinated. In the large burghs the percentage successfully vaccinated ranged from 80·7 in Aberdeen, 60·0 in Edinburgh and 59·0 in Perth, to 24·0 in Clydebank, 22·2 in Hamilton, 21·0 in Greenock and 18·6 in Dunbarton. In Glasgow it was 45·3 and in Dundee 26·1.

Children reported as not vaccinated, or as being constitutionally insusceptible, numbered 46,288, or 55.56 per cent. of the total survivors. In the previous year the number and percentage were 45,093 and 54.75 respectively. Of the 46,288 unvaccinated children, 1,105 were certified as constitutionally insusceptible to vaccination, 40,796 were unvaccinated by reason of Statutory Declaration of Conscientious Objection, 1,489 were unvaccinated by reason of postponement of vaccination with medical certificates, and 2,898 were unvaccinated, or presumed to be so, through being lost sight of by removal from the district of registration or otherwise. (Table 36.)

Certificates of Constitutional Insusceptibility numbered 1,105, which is 273 fewer than in the previous year. This is the smallest number recorded since 1927, when they amounted to 1,030. In the counties certificates of insusceptibility were relatively frequent in Peebles (4·8 per cent.), in Kinross (4·5 per cent.) and in Perth (2·5 per cent.), but were less than 1 per cent. in 17 counties. In the large burghs this percentage varied from 4·9 in Rutherglen and 2·6 in Perth to less than 1 per cent. in twelve burghs. Prior to 1926 these cases normally numbered less than 1,000 per annum, but they have exceeded 1,000 in every year since that date, and in 1929 and in 1932 they numbered more than 2,000. Since the latter

date there has been a substantial decline each year.

Children exempted from vaccination by reason of parental conscientious objection numbered 40,796 and constituted 48:97 per cent. of the total surviving at the time of statutory vaccination. This number is 1,274 more than in the previous year and 3,336 more than the mean of those of the preceding five years. The percentage is 0:98 more than that for the previous year and 4:14 more than the mean of the previous five years. It is the highest percentage of children unvaccinated for this reason which has hitherto been recorded. For the third year in succession the percentage of children in this group is greater than among the successfully vaccinated. In the counties, burghs included, this percentage ranged from 93:0 in Zetland, 78:9 in Orkney, 68:9 in Caithness and 68:7 in Dunbarton, to 17:8 in Kirkcudbright, 16:7 in Nairn, 12:3 in Peebles and 11:5 in Kincardine. In the large burghs it ranged from 79:1 in Dumbarton, 76:0 in Greenock, 73:4 in

Hamilton and 72·3 in Dundee, to 35·4 in Perth, 34·2 in Edinburgh and 14·9 in Aberdeen. It may be pointed out that the same counties and burghs tend to appear year after year among those showing maximum and minimum percentages, and correspondingly among those counties and burghs which show low and high per-

centages respectively of children successfully vaccinated.

Children who were still unvaccinated at the end of 1937 by reason of postponement on medical grounds numbered 1,489 and constituted 1.79 per cent. of those surviving at the time of statutory vaccination. In the previous year this number was 1,502 and the percentage 1.82. During the past few years the percentage of children in this group has tended to diminish, although on this occasion the decline is slight. (Table 36.)

Children whose vaccinations were unaccounted for through removal from the district of registration or otherwise numbered 2,898 and amounted to 3.48 per cent. of the total surviving. In the previous year the corresponding number and percentage were

2,691 and 3.27 respectively. (*Table 36.*)

APPENDIX II.

ADDITIONAL STATISTICS REGARDING MARRIAGES REGISTERED IN SCOTLAND DURING THE YEAR 1936.

A preliminary statement regarding the marriages registered in Scotland during the year 1936 was incorporated in the Eighty-Second Annual Report of the Registrar-General dealing with the detailed statistics of the registered births and deaths of that year, but as full details of the registered marriages were not available at the time when the report was prepared, the statement was necessarily restricted and dealt only with the number of marriages registered in 1936 and the marriage-rates. It is now supplemented by this detailed report on these marriages, including a statistical account of the method of proclamation, the church of celebration, the ages and conjugal conditions of those marrying, and the method of signing the marriage schedules, by writing or by mark.

In the Eighty-Second Annual Report it was stated that the number of marriages registered in Scotland during the year 1936 was 37,914, but after complete examination of the registers the adjusted number was found to be 37,896, the provisional figure being in excess by 18. The marriage-rate for the year 1936, which is 7.631, differs but little from the provisional rate, which was given as 7.634. The corrected number of marriages is 2,910 more than the mean of the number registered annually during the five preceding years, while the marriage-rate is 0.501 above the mean.

(Table 8.)

Regular and Irregular Marriages. - Of the 37,896 marriages registered during the year 1936, 33,393 or 88.1 per cent. were regular, i.e. solemnized by a minister of religion after proclamation of banns or after publication of notice at a registrar's office, while 4,503 or 11.9 per cent. were irregular, i.e. contracted without proclamation of banns or publication of notice and not solemnized by a minister of religion. In the previous year regular marriages constituted 88.5 per cent. of all marriages registered. In the early years of registration irregular marriages were very few, the annual average prior to 1870 being less than 50, but it was 263 between 1871 and 1880, 650 during 1881-90, 1,428 during 1891-1900 and 2,034 during 1901-10. During the period 1911-20, which included the years of the Great War, the average number increased to 5,312. but during the period 1921-30 it declined to 4,287, and compared with that average the total for 1936 is more by 216. The proportion which irregular marriages bear to the total has likewise increased. In 1855-60 it was only 0.09 per cent. and in 1861-70 it was 0.18 per cent., but in 1871-80 the decennial average amounted to 1.04 per cent.. and thereafter it steadily increased to a maximum of 14.90 per cent. in 1911-20, with a subsequent decline to 12.74 per

cent. in 1921-30. The highest figures for individual years were registered during the War period, the percentages then varying from 16.38 in 1917 to 20.48 in 1915. From 1929 to 1935 the tendency was for this percentage to decline slowly, and the percentage for the latter year (11.5) was the lowest since pre-war years, but the rate in 1936 has increased to 11.9. Almost three-fourths of these irregular marriages are registered in Glasgow and in Edinburgh. Of the total marriages registered in the large burghs during 1936, 17.4 per cent. were irregular, while for the rest of Scotland the corresponding percentage was only 1.8. Of these irregular marriages 4,269 took place in the large burghs and 234 in the remainder of Scotland. The former number is 173 more than in the previous year but the latter is 32 fewer. In the large burghs taken individually the percentage of irregular to total marriages ranged from 25.4 in Edinburgh, 21.1 in Glasgow, 20.4 in Dunfermline and 19.2 in Perth, to 0.7 in Port Glasgow, 0.6 in Coatbridge, 0.5 in Greenock and 0.3 in Clydebank and 0 in Rutherglen. In counties, all burghs included, the percentage ranged from 22:5 in Midlothian, 19.4 in Dumfries, 15.9 in Lanark and 12.8 in Angus, to 0 in Kinross, in Peebles and in Selkirk. Of the 4,503 irregular marriages, 4,497 were registered by warrant of the Sheriff and 6 on production of Extract Decree of Declarator. (Tables 9 and 10.)

Method of Publication.—Of the 33,393 regular marriages registered throughout the year, 24,778 or 74·2 per cent. of such marriages were solemnized after proclamation of banns in respect of both parties, 7,855 or 23·5 per cent. after publication of notice in respect of both parties, and 760 or 2·3 per cent. after proclamation of banns for one and publication of notice for the other party. (Table Q.) The percentage of regular marriages celebrated after proclamation

TABLE Q.—Regular Marriages in Scotland in 1936, following Proclamation of Banns or Publication of Notice at Registrar's Office.

	Number.				Percentage of Total for each Church, &c.			Per- centage of
Church of Celebration.	Total.	Banns.	Publication of Notice	_ :	Banus.	Publication of Notice.	Banns and Publi- cation.	Total Regular Mar- riages.

by banns has been steadily increasing in recent years. In 1913, the year before the War, it was 60·3, in 1919 it was 66·1, in 1929 it was 69·9, and although it declined to a small extent in the three years following, it has now risen to 74·2, as already stated. The percentage of those celebrated after publication shows a corresponding

Of the regular marriages in large burghs, 13,452 or 66·2 per cent. of such marriages were celebrated after banns, 6,427 or 31·6 per cent. after publication of notice, and 430 or 2·1 per cent. after banns in respect of one and publication of notice in respect of the other party. In the other districts of Scotland 11,326 or 86·6 per cent. were after banns, 1,428 or 10·9 per cent. after publication of notice, and 330 or 2·5 per cent. after banns and publication of notice. In the county of Kinross all marriages were regular and were preceded by proclamation of banns and in the county of Zetland all the regular marriages were after such proclamation, and this was the case with 98 per cent. or more of the regular marriages celebrated in the counties of Berwick, Caithness, Kirkcudbright, Nairn, Sutherland and Wigtown. (Table 9.)

Table Q has been constructed to show the frequency and denomination of those married after proclamation of banns and after publication of notice. Marriage after banns was relatively most frequent in the Church of Scotland (88.4 per cent.), in the Methodist Church (70.3 per cent.) and in the United Free Church (68.7 per cent.), while marriage after publication of notice was relatively most frequent among the Jews (84.3 per cent.) and in the

Roman Catholic Church (81.1 per cent.).

Church of Celebration. — Of the 33,393 regular marriages, 23,791 or 71·2 per cent. were celebrated according to the forms of the Church of Scotland, 4,925 or 14·7 per cent. according to those of the Roman Catholic Church, 1,215 or 3·6 per cent. according to the forms of the Congregational Church, and 1,026 or 3·1 per cent. according to the forms of the Scottish Episcopal Church. (Table Q.)

TABLE R.—Regular and Irregular Marriages in 1936.

	Number.			Percentage of Total Marriages.

The relative frequency of marriage according to the principal denominations in the aggregate of large burghs and other districts is shown in Table R, for previous years in Table 8, and in individual burghs and counties in Table 10. It will be observed that the proportion of marriages according to the forms of the Presbyterian Churches are relatively less frequent in the large burghs than in other districts. Marriages according to the forms of the Church of Scotland constituted at least 85 per cent. of all marriages registered in the counties of Berwick, Caithness, Kincardine, Kirkcudbright, Peebles, Roxburgh and Wigtown, while Roman Catholic marriages constituted at least 15 per cent. of the total in the counties of Bute, Dunbarton, Lanark and Renfrew. In the large burghs Church of Scotland marriages were relatively most frequent (70 per cent. or over) in Kirkcaldy, in Kilmarnock, in Falkirk, in Rutherglen and in Arbroath, while Roman Catholic marriages were most frequent (25 per cent. or over) in Greenock, in Coatbridge, in Hamilton, in Airdrie, in Dumbarton and in Port Glasgow. A complete list of the principal denominations and communities named in the Marriage Registers for 1936 is given in Table S.

Conjugal Condition of those Marrying.—Of the 37,896 males marrying during the year, 35,409 or 93.5 per cent. were bachelors, 2,213 or 5.8 per cent. were widowers, and 274 or 0.7 per cent. had been divorced. Of the 37,896 women marrying, 36,501 or 96.3 per cent. were spinsters, 1,107 or 2.9 per cent. were widows, and 288 or 0.8 per cent. had been divorced. The combinations of the various conjugal conditions are shown in the following table:—

		Spinsters.	Widows.	Divorced Women.	Total.
Bachelors	• • •	34,679	534	196	35,409
Widowers		1,603	544	66	2,213
Divorced men		219	29	26	274
Total		36,501	1,107	288	37,896

TABLE S.—Marriages in Scotland in 1936 by Denominations, &c. in Order of Frequency.

1. Church of Scotland 2. Roman Catholic Church 3. Congregational 4. Scottish Episcopal 5. Baptist 6. Methodist 7. Free 8. United Free 9. Christian Brethren 10. Salvation Army 11. Jews 12. Free Presbyterian Church 13. Original Secession 14. Unitarian 15. Church of the Nazarene	23,791 4,925 1,235 1,026 520 400 385 348 190 108 102 61 50 48 29	16. Church of Christ 17. Apostolic Church 18. Catholic Apostolic Church 19. Four Square Gospel Church 20. Church of England 21. Reformed Presbyterian Church 22. Church of God 23. --	--	--	---

From the above table it may be deduced that 97.9 per cent. of the bachelors married spinsters, while 1.5 per cent. married widows; that 72.4 per cent. of the widowers married spinsters, while 24.6 per cent. married widows, and that of all males who had been divorced 79.9 per cent. married spinsters, 10.6 per cent. married widows and 9.5 per cent. married women who had been divorced. In the case of all men marrying 96.3 per cent. married spinsters, 2.9 per cent. married widows and 0.8 per cent. married women who had been divorced. Of all spinsters marrying 95:0 per cent. married bachelors and 4.4 per cent. married widowers; among widows 48.2 per cent. married bachelors and 49.1 per cent. married widowers; of women who had been divorced 68.1 per cent. married bachelors, 22.9 per cent. married widowers and 9.0 per cent. married men who had been divorced. In the case of all women marrying 93.4 per cent. married bachelors, 5.8 per cent. married widowers and 0.7 per cent. married men who had been divorced. It will be observed that although 274 divorced men and 288 divorced women remarried during the year, in only 26 cases was it stated that each of the parties to the marriage had been divorced. In 1935 this number was 12. (Table 11.)

Method of Signature.—Of the 75,792 persons who were married during 1936, 94 (58 men and 36 women) signed the marriage schedule by mark and the remainder in writing. This number is slightly higher than that for 1935 (92) but is below the average for recent years. The great decrease in this number since the early days of registration is noteworthy. In the decade 1861-70 an annual average number of 7,123 persons signed by mark, but by 1891–1900 this average had fallen to less than 2,000 and by 1911-1920 to a little over 500 per annum. Since 1925 the annual number has always been less than 200, and since 1932 it has never exceeded 100. The change in the sex proportions is likewise striking. Whereas prior to 1870 females signing by mark outnumbered males by 2 to 1, towards the end of the century this ratio was 1.5 to 1. In recent years the numbers of males and females assigned to this group have been more nearly equal, while on 4 occasions (including 1936) males have actually exceeded females. In 1936 males exceeded females by more than 50 per cent. (Table 8.)

The age distribution of persons signing by mark is shown in Table T and the Church of Celebration in Table U. In the former table it will be observed that, compared with the total marriages registered among persons of a given age, those signing by mark are relatively most frequent at the older ages, 50 years and over. This is more particularly evident among women. In the case of women aged 60 and over the proportion who signed by mark is 4.7 per cent. It may be noted that those signing by mark include a certain number of blind persons. Of the 94 persons who signed by mark 38 were married according to the forms of the Church of Scotland, 19 according to those of the Roman Catholic Church and 11 according

to those of churches of other denominations, while 26 were married irregularly. In 1935 the last-mentioned number was only 7.

Ages of those Marrying.—The average age of all men marrying during the year was 29.5 and of all women 26.6 years. In the aggregate of large burghs the average age at marriage was 29.7 for men and 26.8 for women. In each of these cases this age was slightly higher than in the previous year. In the other districts of Scotland these averages were 29.1 for men and 26.1 for women, these averages being the same as in the previous year. It will be observed that, as is usually the case, the average age is rather higher in the case of marriages celebrated in the large burghs than in those celebrated elsewhere in Scotland. (Tables 12 and 13.)

The average ages arranged according to the conjugal condition

of those marrying are set forth below in tabular form :—

Average ages of—	Spinsters.	Widows.	Divorced Women,	All Women.
Bachelors marrying	28.1	37.7	34.1	28.3
Widowers marrying	45.1	53.9	50.5	47.5
Divorced men marrying	37.3	43.6	40.5	38.3
			701 - 1	
Average ages of—	Bachelors.	Widowers.	Divorced Men.	All Men.
Average ages of— Spinsters marrying	Bachelors. 25.5	Widowers.		
			Men.	Men.

The average age of all bachelors marrying is 0.2 higher than in 1935, that of widowers is 0.4 higher, while that of divorced men is 0.4 lower. The average age of all spinsters marrying is 0.1 more than in the previous year, that of all widows is 0.6 higher, and that of divorced women is 0.4 higher. Tables 14 to 18B show in combination the ages of those who married, together with their conjugal condition before marriage. The ages of divorced men or divorced

TABLE T .- Ages of Persons Marrying who Signed by Mark in 1936.

Age Group.		Numbers.			Percentage who signed by Mark in each Age Group.

women are published in Tables 18A and 18B, but without differentiation to show the conjugal condition of the other spouse, although the results have been tabulated. (*Tables 14–18b*.)

The excess of the average age of bridegrooms over that of brides is 2.9, being the same as in the previous year. Bachelors marrying spinsters were on an average older by 2.6 years, widowers marrying spinsters older by 9.9 years and widowers marrying widows older by 6.2 years, but the average age of bachelors marrying widows is less by 1.1 year. In the case of the last-named group this difference was only 0.2 year in 1935, but all other groups show a slight increase in

the excess of the husband's age. (Tables 14–18.)

The average age of men at marriage ranged in the counties, inclusive of burghs, from 32.7 in Zetland, 32.1 in Ross and Cromarty and 31.9 in Argyll and in Sutherland, to 28.5 in East Lothian and in Fife, 28.4 in West Lothian and 28.3 in Wigtown. The average age of women marrying during the year ranged from 29:1 in Zetland, 28:4 in Ross and Cromarty, 28:3 in Inverness, 28.2 in Bute and 28.1 in Argyll, to 25.8 in Fife, 25.7 in East Lothian, 25.5 in West Lothian and 25.0 in Wigtown. In the large burghs the average age among males ranged from 31.7 in Inverness, 30.7 in Perth, 30.2 in Edinburgh and 30.0 in Ayr and in Dumbarton, to 27.8 in Airdrie and 27.7 in Hamilton and in Port Glasgow. In Glasgow this average was 29.9, in Dundee 29.5 and in Aberdeen 29.6. Among females the average age in the large burghs ranged from 28.2 in Inverness and 27.4 in Edinburgh and in Perth, to 25.6 in Motherwell and Wishaw, in Coatbridge and in Airdrie, 25.2 in Port Glasgow and 25.0 in Hamilton. In Glasgow it was 26.9 and in Dundee and in Aberdeen 26.7. (Tables 12 and 13.)

TOTAL	47	25	11	58	36	94	

The youngest bridegrooms of the year were 2 bachelors aged 16 and 42 bachelors aged 17. One of the latter married a widow but all the others married spinsters, 4 of whom were only 16 years of age. The youngest brides were 247 aged 16, all of whom except 2 married bachelors whose ages ranged from 17 to over 45. The remaining two brides of this age married widowers aged between 20 and 30. (Tables 14–17.)

The oldest men marrying were 7 aged over 80, of whom one was over 85. Two of these were bachelors and 5 were widowers. All of them married brides aged between 40 and 70. The oldest women marrying were 14 over 70 years of age, of whom one was over 75. All but 2 were widows, and all married bridegrooms aged between 60 and 80. Three girls aged 16 married men aged over 30 and 7 aged under 25 married men of over 60. Two bachelors aged under 30 married widows aged over 55. The youngest divorced men who remarried were 3 aged under 25, while 7 were aged over 60. The youngest divorced women were 10 aged under 25, while 4 were aged over 55. (Tables 14–18b.)

APPENDIX III.

REPORT ON THE WEATHER IN SCOTLAND FOR THE YEAR ENDING 31st DECEMBER 1937.

Supplied by the Meteorological Office, Edinburgh.

Under the heading of "Meteorological Notes" a descriptive account of the weather is given in the "Monthly Returns" published by authority of the Registrar-General, and the notes are accompanied by statistics for some of the Principal Towns. The present report, for the whole year, is of a general character as to the text, and to it are appended tables summarizing the statistics of the various stations. (Pp. 133–137.)

General.—The outstanding features of the year are indicated in the course of the report. The most notable were, perhaps:—

- 1. The succession of gales throughout January and the abnormally heavy rainfall in that month over a large part of the country.
- 2. The exceptional cold of March and December—unequalled since 1919—with comparatively warm conditions in almost every intervening month.
- 3. The marked deficiency of rainfall over the north-western part of the country in the last quarter of the year.

Pressure and Winds.—Barometric pressure was 0.04 inch below the normal for the year as a whole. The monthly pressure means were below normal in the seven months January to April, June, July and September, and above normal in the remaining five months. The greatest departure from the normal was in February, when the mean pressure was 29.462 inches or 0.410 inch below normal. January, with a mean pressure 0.279 inch below normal, was the only other month in which the departure from normal exceeded 0.2 inch.

In January there was a remarkable excess of winds between east and south, and gales were reported on every day from one part or another of Scotland. The areas chiefly affected were Shetland and Orkney, North-east Scotland and the western seaboard. Winds were chiefly from south-west or west in February, and gales, mainly affecting the northern and western coastal districts, were frequent. There was a pronounced excess of winds from north and north-east in March, associated with high barometric pressure to the north of the British Isles. April had a slight excess of north-east and east winds with less stormy weather than in the first quarter of the year. In May there was a slight excess of southerly winds, but June had an excess of winds between north and west.

From July to November the wind distribution generally approximated to the normal, but August and October each had two more days of calms than the normal. Cold north or north-east winds predominated in December, when severe wintry conditions occurred everywhere in Scotland.

Noteworthy Gales.—In January there was an almost constant succession of gales and these were of extreme severity in the north and west. Much damage was caused to harbours and shipping. In Orkney the month was one of the stormiest in living memory and the tempestuous seas caused considerable coast erosion. In the course of the month gusts of gale force or over were registered at Kirkwall during 395 hours. The highest gusts recorded were 83 m.p.h. at Lerwick on the 25th and 82 m.p.h. at Kirkwall on the 24th. Gales occurred on 19 days in February, the most severe being that of the 27th to 28th which swept the whole of Britain; the highest wind gust registered in Scotland was 78 m.p.h. at Bell Rock. Between March and October, though gales occurred on the north and west coasts, no exceptionally high wind speeds were recorded. November was for the most part quiet for a winter month, but a gust of 78 m.p.h. was recorded at Lerwick in the gale on the 25th. Gales occurred in December on 22 days, the most severe being on the 14th and 22nd, but no exceptionally high wind speeds were recorded.

Temperature.—Mean temperature for the country as a whole was exactly equal to the normal. 1937 was the seventh successive year with a mean temperature equal to or above normal. Only February, March and December had mean temperatures below normal. The deficiencies in March and December amounted to 4.0° and 4.2°F. respectively. In November the mean value was equal to the normal. The remaining eight months had mean temperatures exceeding the normal, but only in April and May did this excess amount to so much as 2°F. Some remarkably low temperatures were recorded in March. On the 8th the screen minimum registered at Braemar was 0°F., which was the lowest screen temperature recorded in March since 1917. On the same day thermometers exposed on the ground registered -2°F. at Braemar and -1°F. at Dalwhinnie. Measured by its mean temperature, March was the coldest month of that name in Scotland since 1919 and March 1919 was the coldest for at least 60 years. December was an even colder month with some temperatures below zero on the 13th, namely -7°F. at Braemar, -5°F. at Logie Coldstone and -3°F. at Balmoral. These are the lowest temperatures recorded anywhere in Scotland under standard conditions since 14th November 1919, when Braemar reported -10°F. The period of greatest warmth was from July 31st to August 2nd, during which shade temperature reached 84°F. at Ruthwell, 81°F. at Dumfries and Kilmarnock, and 80°F. at Kelso, Glenlee and Achnashellach. Other warm periods occurred around May 29th, when 75°F. was recorded at Forres and Gordon Castle, and around June 25th, when 78°F. was reached at Balmoral, Montrose and Logie Coldstone and 77°F. at Dundee.

Rainfall.—As in 1936, rainfall over Scotland as a whole was deficient, the general rainfall representing 92 per cent. of the normal. January, with 162 per cent. of its normal fall, was easily the wettest month, February coming next with 136 per cent. November was by far the driest month, having only 30 per cent. of its normal rainfall. April was the second driest month with 71 per cent. of the normal, followed closely by March, May and December, all with less than 80 per cent. of their respective normals. The excessive rainfall of January was most marked in the east of Scotland, and especially on Deeside. Aberdeen with 4.96 inches experienced the wettest January since records commenced in 1871. Balmoral and Braemar with 11:80 inches and 13:41 inches respectively had more than four times their normal rainfall. At Braemar it was by far the wettest month since records began there in 1866. In the east of Scotland the months of February, March, June, July and December all vielded abundant rainfall. In the west June, July and September showed an excess over the normal. April, August and October in most parts showed a deficiency, and March a considerable deficiency except on the east coast. November, as has been noted, was much the driest month. Many new low records were established in this month. In Edinburgh it was the driest November in over 160 years of recorded totals. In the Western Highlands December was also notably dry, some places having only a quarter of the normal precipitation. Over the country as a whole December was the fifth successive month with a deficient rainfall.

Snow.—The snowstorm of 29th and 30th January was very severe. There was much drifting and roads became blocked in southern, eastern and central Scotland. Snow occurred fairly frequently in February, the heaviest falls being on the 27th and 28th, when deep drifts were reported in almost all parts of the country. Roads in some districts were blocked for long periods. Much of the precipitation in March was also in the form of snow. The most severe storm was that of the 12th to 14th, with a northeasterly gale, when railway lines as well as roads were blocked, and drifting to a depth of 10 or 12 feet was reported in places. Towards the end of the year the heaviest snowstorms were those between the 8th and 15th December. These caused serious dislocation of road and rail traffic and also of telegraphic and telephone services. Some Highland roads remained blocked to the end of the month.

Thunder.—Thunder was reported in some localities each month, being most frequent in May and July. The storm of January 22nd

extended over a considerable area in south and central Scotland. Heavy rain and hail accompanied a severe storm in Kinross on May 17th. On August 13th thunderstorms were unusually widespread and in some places exceptionally severe. In the latter months of the year the only storm of considerable extent was that on December 7th.

Flooding.—Some flooding occurred at Milnathort (Kinross) as a result of the severe thunderstorm of May 17th. The thaw on December 21st and 22nd, following a period of heavy snowfall, caused the highest flood in the Tweed for many years.

Sunshine.—The totals of bright sunshine were below normal over almost the whole of Scotland. There were exceptions locally in the west, along the Great Glen and in Orkney. The deficiencies were relatively greatest on the east coast, where in some cases the amounts recorded were about 140 hours below the average for the district. Of the individual months, February had, relatively, the best record, with an average of about an hour per day above the normal. March, May and August were also sunny months. On the other hand, April's sunshine showed the greatest deficiency. Many places had less than 100 hours for this month, these figures constituting new low records in several cases. January, June, July, October and November all had deficiencies, though of less outstanding proportions. Tiree had easily the highest aggregate of the year, 1419 hours, followed by Turnberry and Troon in the west and Leuchars and Arbroath in the east.

Fog.—Fog occurred in every month but it was not usually wide-spread. It was fairly persistent in the Clyde area in February and March. Glasgow had nine days of fog in the latter month. Throughout the summer months such fog as occurred was of the coastal type. December had the greatest number of days with fog in one place or other. The fogs of the first week of December were the most widespread of the year.

Aurora.—Aurora was observed in every month except June, July and August. It was most frequent in October (15 nights) and November (16 nights). The phenomenon was observed over the greater part of the country on April 24th, 25th, September 10th, 11th and December 24th and 25th. Unusually brilliant displays were reported on September 30th and November 30th.

[For Statistical Tables, see page 133.]

APPENDIX IV.

RE-REGISTRATION OF BIRTHS.

REGISTRATION OF BIRTHS, &C. (SCOTLAND) (AMENDMENT) ACT, 1934.

This Act, which came into force on 1st January 1935, provides that the Registrar-General may authorise re-registration of the births of persons born illegitimate who have been legitimated by the subsequent marriage of their parents, and also of persons the original entry of whose birth is affected by any matter contained in the Register of Corrected Entries respecting status or paternity.

The number of re-registrations authorised in each year was as

follows :-

Year.			No.
1935		 	 1,259
1936		 	 1,063
1937	2 6 e	 	 1.048

ADOPTED CHILDREN REGISTER.

Adoption of Children (Scotland) Act, 1930.

This enactment provides for the legal adoption of children in Scotland by Order of the Court, and for the registration of such adoptions in an Adopted Children Register kept at the General Registry Office, Edinburgh. This Register is open for search and Extract purposes under the same conditions as are the Registers of Births, Deaths and Marriages, and an Extract from the Adopted Children Register is evidence of adoption, and also of the date of birth of the child if such date is recorded in the relative entry. The Act came into operation on 1st October 1930, and the following Table shows the number of Adoptions recorded in each year:

Year.		No.	Year.			No.
1930	 	3	1934			602
1931	 	347	1935			683
1932	 	492	1936		* * *	704
1933	 	437	1937	• • •	• • •	820

SEARCHES AND EXTRACTS.

The principal records maintained in the General Registry Office, Edinburgh, are the duplicate Registers of Births, Deaths and Marriages for every Registration District in Scotland, kept under the provisions of the Scottish Registration Acts, 1854–1934, and the Parochial Registers of Births and Baptisms, Proclamations of Banns and Marriages, and Deaths and Burials kept prior to 1855 in the

respective parishes under the administration of the Church of Scotland. The earlier Census records in the custody of the Registrar-General, including those relating to the decennial censuses from 1841 to 1871 inclusive, have also been made available for search and extract purposes under prescribed conditions.

The following Table shows the number of searches made and

extracts issued during each of the past ten years :-

YEAR.	Total Searches.	Official Searches.	l'aid Searches.	Extracts.	Total Fees received.
1928 1929 1930 1931 1932 1933 1934 1935 1936 1937	48,239 38,691 92,926 40,355 35,188 33,199 32,817 34,725 30,734 37,107	34,351 24,304 79,362 28,184 22,608 20,535 19,823 21,084 16,341 21,338	13,888 14,387 13,564 12,171 12,580 12,664 12,994 13,641 14,393 15,769	10,863 11,805 12,599 8,907 8,930 8,767 8,505 9,528 9,192 10,929	$\begin{array}{cccccccccccccccccccccccccccccccccccc$

Of the 21,338 official searches made in 1937; 17,882 (including 3,501 searches in the Census Returns) were for the purposes of Widows, &c. Contributory Pensions Acts, 2,079 (including 211 Census searches) for those of the Old Age Pensions Acts, and 1,377 for other public purposes. The number of Extracts shown for 1937 includes 906 Abbreviated Certificates of Birth issued under Section 4 of the Registration (Scotland) Amendment Act, 1934.

APPENDIX VI.

FERTILITY OF MARRIED WOMEN IN SCOTLAND.

The lack of a modern measure of the age fertility of married women in Scotland has hampered scientific investigations into population problems. The earliest source of information from which a study of fertility rates could have been made for Scotland was provided in the Birth Registers for 1855—the year in which registration of births, deaths and marriages became compulsory—but the particular form of birth entry adopted in that year was discontinued in the following year, and since then the birth entry has shown neither the age of the mother nor the order of birth (first, second child). The Census Schedule for 1911 contained the following three special items dealing with fertility in the case of married persons:—

(1) The duration of the existing marriage.

(2) The number of children born alive to the marriage.

(3) The number of children of the marriage still alive at the Census date.

While no analysis of the fertility of Scottish women based on the 1855 data has ever been published officially, the information then obtained formed the basis of two private investigations, the findings of which were published many years ago. The results of the answers to the fertility questions at the 1911 Census were published in Volume III of the Census Report for that year, and were the subject of a special study which was published as an Appendix to the same Census Volume. It may be pointed out, however, that the fertility rates based on the 1911 Census Returns are not indicative of the fertility operating in 1911. They represent the cumulative fertility rates throughout all the years of married life of the married couples whose marriages were subsisting in 1911. It follows, therefore, that the children on whose births the fertility rates were based were born during a period extending over 50 years.

The subject of fertility has come into prominence in recent years, and the data which will be accumulated under the Population (Statistics) Act, which became operative on the 1st July 1938, will afford valuable material for studying the subject. In view of the importance of having a comparison between Scottish fertility rates and those already published for England and Wales, and of having a measure from which future fertility trends can be estimated, it was deemed advisable to attempt to investigate the subject from certain data available from the 1931 Census Schedules. Although the Schedule contained no question relating to the number of children which resulted from a marriage, a con-

siderable amount of information may be derived from an analysis of those cases in which (as generally happens) the mother and her infant child (under one year) are enumerated on the same Schedule. In view of the great difficulty in linking up mother and child on the Census Schedules in the case of illegitimate births, the enquiry was limited to legitimate births. It was found impracticable to make a complete survey of all the Census Schedules, but it was thought that a ten per cent. sample would yield useful results in reference to the fertility of married women at various ages.

To obtain a random sample every tenth Enumeration Book was examined for the existence of a child aged under one year. In some cases where the books examined appeared to give too low a proportion of burghal or of landward entries in a particular county or area, one or two additional books were examined to redress the balance, but except in these rare cases the sample was entirely

random.

In the most typical case in which the father is the Head, the mother and child are easily identified as Wife and Son (or Daughter) respectively, but even where this relationship was not so clear it could sometimes be established by some other relationship as Daughter (Married), Grandson (same surname Daughter)," or "Head, Sister (Married), Niece (same surname as Sister)." But unless the mother could be identified with reasonable certainty the observation was rejected. In some cases (e.g. where either mother or child may have been in a hospital or institution) no contact could be established.

In order to obtain the precise age of the mother at the date of the child's birth, the age of the child at the date of the Census was deducted from that of the mother. In some cases where the mother's age seemed rather advanced, further investigation indicated the probability that the child had been adopted and the case was rejected. Out of a total of 86,134 children under one year of age enumerated in Scotland, 8,672 were found in the books examined, and the legitimate children whose identification with the mother could be established numbered 7,799, which therefore represents the net number of valid observations. Only one case of a mother over age 50 was retained in the sample after investigation.

After the results had been completely tabulated according to the age distribution of the mothers, the number of mothers at each age was increased pro rata in the proportion which the total number of legitimate births registered in Scotland in 1931 (85,559) bore to the number (7,799) in the sample. On the assumption that the sample was a fair one, this gives the age distribution of the mothers of the 85,559 legitimate children born in 1931. It may be pointed out. however, that it was necessary to assume a uniform survival rate for the infants irrespective of the age of the mother. This may not be quite the case, but any variation is unlikely to impair seriously the reliability of the fertility rates.

The resulting numbers were then compared with the numbers of married women enumerated at each age-group in Scotland in 1931. The size of the sample appeared to make it undesirable to base any rates on age of mothers in single years, and quinquennial age-groups were therefore used. For the same reason division into areas was sparingly carried out, but rates were calculated, not only for Scotland as a whole, but for the principal groups used in these Reports, viz.:—Large Burghs and the combined Counties excluding Large Burghs, the second group being further divided into Small Burghs and Landward. Separate rates were also compiled for Glasgow and

for Edinburgh.

The results are shown in the appended Table. To this Table there has been added the result of a fertility investigation undertaken in respect of England and Wales from the Census records of 1931.* In the last column of the first part of the Table the rates so found for England and Wales are expressed as a percentage of the Scottish rates. The differences are significant, but are of the order which might have been anticipated by reference to the relative overall fertility rates in the two countries. The published fertility rate for England and Wales in 1931 is 122.7 legitimate births per 1,000 married women aged 15-45, as against 168.3 for Scotland (i.e. Scotland=100, England and Wales=72.9). It will be observed from the Table that, while for ages under 20 the English rate is 37 per cent. less than in Scotland, this deficiency diminishes with remarkable regularity until it is only 8 per cent. at ages 40-44. The only break in this regular sequence is at ages 35-39, where the English deficiency increases slightly to 25 per cent., whereas a lower deficiency might have been expected from the trend of the percentages. The comparison between the English and the Scottish rates suggests that generally the Scottish rates ascertained by the sample may be considered to be a close approximation to the rates which would have resulted from a complete analysis of the whole Census data, and they are published in the hope that they may be found useful by investigators in this field. As already stated, the data which will be produced by the Population (Statistics) Act will enable the publication of fertility statistics in the future on a wider basis and with much greater detail.

APPENDIX VII.

NOMENCLATURE IN SCOTLAND.

Under the above heading a section of the Registrar-General's Annual Report for the year 1860 gave the results of an examination of surnames and Christian names appearing in the General Indexes of Births, Deaths and Marriages for the three years 1855, 1856 and 1858.

In view of the changes which have taken place in the social and industrial life of Scotland since the previous investigation was undertaken, and of the much greater facilities now available for rapid transport which lead to a greater movement of population not only across the border but overseas, it is thought that the results of an investigation into the frequency of occurrence of surnames and Christian names at the present time would be of some public interest. For this purpose an examination was made of the Birth, Death and Marriage Indexes for the year 1935 for surnames, and of the Birth Indexes only for the same year in respect of Christian names.

In the Report for 1860, 6,823 surnames were noted, but in 1935 there was found the surprising total of 14,666 surnames. This latter figure, however, included variations of spelling of the same surname. By eliminating as far as possible these variations, and enumerating each surname under only one spelling—the one most frequently found in the Indexes—a total of 11,976 surnames remains. Thus surnames found in Scotland have risen from 6,823 found eighty years ago to 11,976 in 1935, an increase of 5,153. Many of the unusual names or unfamiliar spellings included in the larger total (14,666) occur only once in the Indexes for 1935. This variety of surnames is illustrated by the following section (selected at random) of 50 consecutive surnames:—

Legbetter. Lee. Leigh. Leckenby. Leebody. Legg. Leighton. Leckie. Leeburn. Leggat. Leil. Lecky. Leechman. Leggate. Leino. Ledder. Leed. Leggatt. Leinster. Leddie. Leel. Legge. Leiper. Leddy. Leeming. Leggeat. Leishman. Ledger. Lees. Legget. Leisk. Ledgerwood. Leesi. Leggett. Leitch. Ledingham. Leeson. Legrix. Leitchman. Lefcovitch. Ledley. Lehalle. Leith. Ledwitch. Lefevre. Lehany. Ledwith. Legate. Leid.

The following table gives the 100 most usual surnames as shown by a complete examination of the Birth, Death and Marriage Indexes for 1935. These surnames are shown in the order of the frequency in which they occur. In 1860 only the first fifty names were published, and a column is added to the table showing the position occupied in 1860 of such surnames as appeared in the first fifty in that year.

No.	Surname.	Occurrences.	No. in 1860 Report.	No.	Surname.	Occurrences.	No. in 1860 Report.
85	Lindsay	487		93	Donaldson	454	
86	Christie	485		94	Fleming	454	
87	Alexander	475		95	Aitken	452	
88	Currie	474		96	MacNeil	449	
89	Forbes	466		97	Boyd	446	
90	Hay	460	0 0 0	98	Bain	441	
91	Hughes	456		99	Jamieson	434	
92	MacKinno	n 456	9 9 0	100	MacDougal	ll 431	

The following names occur in the same place in 1860 and 1935:—

1.	Smith.	7.	Campbell.
2.	MacDonald.	9.	Anderson.
3.	Brown.	17.	Paterson.
5.	Thomson.	50.	Gibson.

Only four of the fifty surnames of 1860 do not also appear in the first fifty in 1935. They are: MacGregor (now 51), Sutherland (now 54), Munro (now 65) and Sinclair (now 66). These names are replaced in the first fifty by MacIntosh, Kelly, MacMillan and Russell.

It will be seen that the intervening years have not greatly altered the positions of the most usual surnames, though thousands of new surnames of English, Irish or foreign origin have been introduced into Scotland. In spite of the flow from Ireland to Scotland, the only typically Irish name to be included in the first fifty is Kelly, which obtained 47th place, but Docherty, Murphy and Gallacher appear in the next fifty.

CHRISTIAN NAMES.

The 1860 Report gives tables showing frequency of occurrence of 39 male and 51 female names, but the investigation then was confined to the Christian names attached to the first six most usual surnames in the case of male and to the first seven in the case of female. The present investigation covered all surnames appearing in the 1935 Birth Indexes. In order that modern choice in Christian names might be reflected, only the Birth Indexes were examined for this purpose. As with surnames many of the Christian names are spelt in a great variety of ways, for example:—

Kathaleen,	Cathaleen,
Kathalien,	Cathelene,
Katheleen,	Catheline,
Kathieleen,	Cathleen,
Kathleen,	
Kathlen,	
Kathlyn,	

but for the present purpose Christian names have, as far as possible, been classified under their most usual forms and only the first Christian name has been scheduled.

Males.

The male Christian names found in 1935 totalled no less than

616, and of these 324 occurred only once in the Index.

The following table shows the 100 male Christian names most frequently used in Birth Registers in 1935. As already stated, only 39 male Christian names were published in 1860. A column is added showing the position occupied in 1860 by such 39 names.

90	Roger	26		99	Russell	18	
91	Cornelius	25	• • •	100	Sinclair	18	

The name Ebenezer occupied the 39th place in 1860, but in 1935 only appears five times.

It will be seen that of the first ten names five retain the same

position as in 1860, viz. :-

- 1. John,
- 2. James,
- 3. William,
- 6. George,
- 9. Andrew,

4 and 5 (Robert and Alexander) change places as do 7 and 8 (David and Thomas), but the last of the ten—Ian—does not appear in the 1860 list. It may then have been included as John, but it would appear that the name "Ian" has grown in popularity in recent decades. Other Highland male names have, however, declined in numbers, for example, Colin, Roderick, Dugald and Lachlan all have lost popularity since 1860.

Biblical names like Abner, Gideon, Ezekiel, &c., once fairly

common have now almost fallen into disuse.

Females.

Female Christian names were found to total 727, and 354 of

these were only once found in the Index.

The following table shows the 100 female Christian names most frequently used in the 1935 Birth Registers. As already stated, only 51 female names were published in 1860. A column is added showing the position occupied in 1860 of such of those 51 names as appeared in the first 100 in the 1935 Registers.

The names which occurred amongst the first 51 female Christian names in 1860 and which do not occur among the first 100 of 1935, with their position in 1860, are:—

Eliza	18th p	lace i	n 1860.	Rebecca	41st	place ii	n 1860.
Betsy	19th	, ,	, ,	Harriet	45th	,,	, ,
Amelia	31st	, ,	,,	Susannah	47th	, ,	, 1
Louisa	39th	, ,	, ,	Sophia	51st	, ,	, ,
Matilda	$40 ext{th}$	1.1	11				

While the first three of 1860 retain their places, there is evidence of a marked change of fashion in the names chosen for girls. The popularity of Sheila, Irene, Dorothy, Maureen and June is shown by their high place in this list, while in 1860 none of these is mentioned.

A further evidence of change of habit is exemplified by the fact that in 1860 less than 40 per cent. of births registered bore more than one Christian name, but now more than 60 per cent. have two or more Christian names.

The choice of more than one Christian name is much more usual for girls than for boys. The actual proportions found being as follows:—

Boys—Single Christian name	 45.5	per	cent.
Two or more Christian names			
Girls—Single Christian name	 29.1	, ,	2.1

NOTES ON METEOROLOGICAL TABLES, 1937.

Up to and including the year 1930 tables giving monthly values for a large number of individual stations were printed in extenso. So far as possible the tables have now been reduced to summary form. More detailed information may be obtained from the Meteorological Office, Edinburgh, and from the following official publications:

The Monthly Weather Report of the Meteorological Office, price 1s. net each month.

The Weekly Weather Report of the Meteorological Office, published in an annual volume, price 7s. 6d. net.

The Book of Normals of Meteorological Elements of the British Isles, price 12s. 6d. complete, but obtainable in sections.

Averages of Temperature for the British Isles for periods ending 1935, price 1s. 3d. net.

Averages of Bright Sunshine for the British Isles for periods ending 1935, price 1s. net.

The observations of pressure in Table II have been reduced to mean sea-level, and reduced for the value of gravity to Lat. 45°.

The Air Temperatures throughout are from standard thermometers exposed in the regulation "Stevenson Screen."

Averages or normals in the case of pressure and rainfall refer to the period 1881-1915. In the case of temperature and sunshine, percentages of and departures from normal are calculated with reference to the period 1906-35; all the absolute values of the District Averages given in Table I refer to the period 1881-1915 however.

In Table II the figures, with the exception mentioned in the footnote, are extracted from the Monthly Reports already published by the Registrar-General for Scotland and relate to the eleven towns, Glasgow, Edinburgh, Dundee, Aberdeen, Paisley, Greenock, Perth, Kirkcaldy, Kilmarnock, Ayr and Dunfermline.

^{*}In this Table Air Pressure and Wind Observations are based on records at seven towns and the means of Air Temperature and Daily Range of Temperature on records at eleven towns. The Absolute Extremes of Temperature refer to Scotland as a whole. The generalized figures for Rain are based on a large number of observations and are extracted from the Monthly Weather Report of the Meteorological Office.
